

# Exploring Weights Dependence with Body Dimensions Measurements

THROUGH MULTIPLE REGRESSION ANALYSIS

RYAN Z & PRADIP D.

# Motivation and project outline

2

- ▶ To design a regression model for predicting or estimating weight dependence using body dimension measurement
- ▶ Separated data into training and test set
- ▶ Adequately check regression models through internal analysis
  - Residual analysis
  - Variable inflation factors
  - High Leverage
  - Outliers
- ▶ Model validation
- ▶ Testing data set

# Key assumptions for linear regression analysis

3

- ▶ The response variable  $y$ , must be independent and identically collected and follow normal distribution
- ▶ The error term  $\epsilon$ , of the model, must have an  $E(\epsilon) = 0$  and  $\text{Var}(\epsilon) = \sigma^2$ .
- ▶ The errors are constant and uncorrelated.
- ▶ The regressors are random variables.
- ▶ Linearity of the model.

# Exploration of data

1/2

4

- ▶ **Dimension of original data set:**  
**25 variables**  
**507 observations.**
- ▶ **Variables:**  
**24 continuous**  
**1 discrete**

Variable Names	Units	Type	Min	1st Qu	Median	Mean	3rd Qu	Max
Biacromial diameter	cm	Continuous	32.4	36.2	38.7	38.82	41.2	47.4

# Variable inflation factors multicollinearity

- ▶ VIF > 5 or 10 show high correlation with other regressor variables.
- ▶ Data set are measurements of body dimensions with high multicollinearity
- ▶ Could eliminate some regressors but 7 have VIF:

10 > VIF > 5

and 6 have VIF:

VIF > 10

# Summary

25

- ▶ **Original model: 24 regressors  
457 observations**
- ▶ **New model outliers  
removed: 436 observations**
- ▶ **Stepwise model: 15  
regressors**
- ▶ **Stepwise new model : 16  
regressor**
- ▶ **Log transformation model  
largest R-squared**
- ▶ **Log transformation new  
model: 446 observations**

Values	Original model	Outliers removed	Stepwise Selection	Stepwise selection, outliers removed	Original model, y log transformation	Original model, y log transformation, outliers removed
R-Square	0.9767	0.9787	0.9764	0.9804	0.9806	0.9793
Adjusted R- Square	0.9754	0.9776	0.9756	0.9796	0.9795	0.9782
Mallow's Cp	25	25	13.55	14.52	25	25
Mean Square residual	4.48	0.00084	4.45	0.0082	3.375	0.0082

# Model validation table of coefficients

26

- ▶ No variables had a negative correlation w/ weight
- ▶ Many coefficients are close to zero
- ▶ Negative signs prove multicollinearity

# Conclusions using test data set

27

- ▶ Test data set: 25 variables 50 observations
- ▶ Multiplied coefficients of models to data set
- ▶ Subtracted actual  $y$  by predicted  $y$
- ▶ Squared the difference
- ▶ Then summed

	Original Model	New Model	Stepwise Model	Stepwise New Model	Transformed Model	Transformed New Model
Sum Squared error	199.5227	193.1022	202.3834	199.3124	0.034227	0.033774
